Art Unit: 2135

# **DETAILED ACTION**

1. Claims 1-11 have been examined.

## **Priority**

- 2. Acknowledgment is made of Applicant's claim for foreign priority based on an application filed in Taiwan on 27 December 2002. It is noted, however, that applicant has not field a certified copy of the 091137721 application as required by 35 U.S.C. 119(b).
- 3. Should applicant desire to obtain the benefit of foreign priority under 35 U.S.C. 119(a)-(d) prior to declaration of an interference, a translation of the foreign application should be submitted under 37 CFR 1.55 in reply to this action.

## **Drawings**

4. The drawings are objected to under 37 CFR 1.83(a). The drawings must show every feature of the invention specified in the claims. Therefore, the algorithm comprising the steps of in claim 1, lines 16-24 on page 18 and line 1 on page 19 must be shown or the feature(s) canceled from the claim(s). No new matter should be entered.

Corrected drawing sheets in compliance with 37 CFR 1.121(d) are required in reply to the Office action to avoid abandonment of the application. Any amended replacement drawing sheet should include all of the figures appearing on the immediate

Application/Control Number: 10/615,065

Page 3

Art Unit: 2135

prior version of the sheet, even if only one figure is being amended. The figure or figure number of an amended drawing should not be labeled as "amended." If a drawing figure is to be canceled, the appropriate figure must be removed from the replacement sheet, and where necessary, the remaining figures must be renumbered and appropriate changes made to the brief description of the several views of the drawings for consistency. Additional replacement sheets may be necessary to show the renumbering of the remaining figures. Each drawing sheet submitted after the filing date of an application must be labeled in the top margin as either "Replacement Sheet" or "New Sheet" pursuant to 37 CFR 1.121(d). If the changes are not accepted by the examiner, the applicant will be notified and informed of any required corrective action in the next Office action. The objection to the drawings will not be held in abeyance.

# Specification

- The disclosure is objected to because of the following informalities:
   For example,
- a. Page 9, line 16, "from both C safe-error attack" should be "from C safe-error attack;
  - b. Page 10, line 22, "a one" should be "one";
     Check the specification and correct any informality the Applicant is aware of.

Application/Control Number: 10/615,065

Art Unit: 2135

## Claim Objections

- 6. Claims 1-11 are objected to because of the following informalities:
  - For example,
  - a. In claim 1, line 11, "as a one" should be "as one";
  - b. In claim 5, line 22, "crypotographic" should be "cryptographic";
  - c. In claim 8, line 14, "as a one" should be "as one";
- d. Any claim not specifically addressed, above, is being objected as incorporating the deficiencies of a claim upon which it depends.

Appropriate correction is required.

Check the claims 1-11 and correct any informality the Applicant is aware of.

#### Claim Rejections - 35 USC § 112

The following is a quotation of the second paragraph of 35 U.S.C. 112:

The specification shall conclude with one or more claims particularly pointing out and distinctly claiming the subject matter which the applicant regards as his invention.

7. Claims 1-11 are rejected under 35 U.S.C. 112, second paragraph, as being indefinite for failing to particularly point out and distinctly claim the subject matter which applicant regards as the invention.

Claim 1 recites the limitations "a fourth bit" is recited in line 17. Since there are no first bit, second bit or a third bit in the claim, "a fourth bit" is undefined. Additionally, "said fourth value" recited in lines 22 and 24 lacks of an antecedent basis for this limitation in the claim.

Art Unit: 2135

Claim 5 recites the limitations "a fourth bit" is recited in line 3, page 20. Since there are no first bit, second bit or a third bit in the claim, "a fourth bit" is undefined.

Additionally, "said fourth value" recited in lines 11 and 16 lacks of an antecedent basis for this limitation in the claim.

Claim 8 recites the limitations "a fourth bit" is recited in line 3, page 20. Since there are no first bit, second bit or a third bit in the claim, "a fourth bit" is undefined.

Additionally, "said fourth value" recited in lines 25 and 26 lacks of an antecedent basis for this limitation in the claim.

Any claim not specifically addressed, above, is being rejected as incorporating the deficiencies of a claim upon which it depends.

# Claim Rejections - 35 USC § 101

8. 35 U.S.C. 101 reads as follows:

Whoever invents or discovers any new and useful process, machine, manufacture, or composition of matter, or any new and useful improvement thereof, may obtain a patent therefor, subject to the conditions and requirements of this title.

9. Claims 1-11 are rejected under 35 U.S.C. 101 because the claimed invention is directed to non-statutory subject matter.

Claims 1-4 are directed to a method for protecting public key schemes. The examiner respectfully asserts that the claimed subject matter does not fall within the statutory classes listed in 35 USC 101. The claimed steps do not result in a tangible result. Claims 1-4 are rejected as being directed to an abstract idea (i.e., producing non-tangible result) [tangible requirement does require that the claim must recite more

Art Unit: 2135

than a 101 judicial exception, in that the process must set forth a practical application of that 101 judicial exception to produce a real-world result, Benson, 409 U.S. at 71-72, 175 USPQ at 676-77).

Claims 5-7 are directed to an apparatus for protecting public key schemes. However, it appears that the apparatus would reasonably be interpreted by one of ordinary skill in the art as software, per se. There is no element positively recited as part of the apparatus. Applicant's specification provides no explicit and deliberate definition on any element positively recited as part of the apparatus, and it appears that such would reasonably be interpreted as representative of the software which protects public key schemes from timing, power monitoring and fault attacks. As such, it believed that the apparatus of claim 5-7 is reasonably interpreted as functional descriptive material, per se.

Claims 8-11 are directed to a computer-readable medium for protecting public key schemes. The examiner respectfully asserts that the claimed subject matter does not fall within the statutory classes listed in 35 USC 101. The claimed logic code does not result in a tangible result. Claims 8-11 are rejected as being directed to an abstract idea (i.e., producing non-tangible result) [tangible requirement does require that the claim must recite more than a 101 judicial exception, in that the process must set forth a practical application of that 101 judicial exception to produce a real-world result, Benson, 409 U.S. at 71-72, 175 USPQ at 676-77).

Art Unit: 2135

## Claim Rejections - 35 USC § 103

10. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

- (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 11. The factual inquiries set forth in *Graham* v. *John Deere Co.*, 383 U.S. 1, 148 USPQ 459 (1966), that are applied for establishing a background for determining obviousness under 35 U.S.C. 103(a) are summarized as follows:
  - 1. Determining the scope and contents of the prior art.
  - 2. Ascertaining the differences between the prior art and the claims at issue.
  - 3. Resolving the level of ordinary skill in the pertinent art.
  - Considering objective evidence present in the application indicating obviousness or nonobviousness.
- 12. This application currently names joint inventors. In considering patentability of the claims under 35 U.S.C. 103(a), the examiner presumes that the subject matter of the various claims was commonly owned at the time any inventions covered therein were made absent any evidence to the contrary. Applicant is advised of the obligation under 37 CFR 1.56 to point out the inventor and invention dates of each claim that was not commonly owned at the time a later invention was made in order for the examiner to consider the applicability of 35 U.S.C. 103(c) and potential 35 U.S.C. 102(e), (f) or (g) prior art under 35 U.S.C. 103(a).
- 13. Claims 1-11 are rejected under 35 U.S.C. 103(a) as being unpatentable over Kocher et al. (U.S. Patent 6,298,442) in view of Benoit (WO/2001/055838) (English

Art Unit: 2135

translation is provided by US Pub. No. 2003/0053621 and the rejections below refer to the English translation)

As per claim 1, Kocher et al. discloses a method for protecting public key schemes from timing, power monitoring and fault attacks comprising the steps of: obtaining a message for use in a cryptographic operation (obtaining a base representative of at least a portion of said message – e.g. claim 18/a); obtaining a modulus and an exponent corresponding to said cryptographic operation (claim 18/a), wherein said exponent contains at least one bit (y is the exponent of k bits in length – e.g. col. 4, line 17); initializing a first value as a one (R=1 in step 100 of fig. 1), executing a modulo exponentiation algorithm on each bit of said exponent from the most significant bit to the least significant bit (col. 4, lines 19-27 and col. 5, lines 63-67) wherein said algorithm comprising the steps of:

input a bit to an inverter and storing the output as a third value, and assigning the next bit of said bit as a fourth bit (col. 6, lines 12-19); if said third value is a zero, updating said first value with the result of squaring, modulo said modulus said first value, if said third value is a one, updating said first value with the result of multiplying, modulo said modulus said first value by said second value (col. 7, lines 57-60, claims 19/a, 19/b and col. 7, lines 18-23); and if said fourth value is a zero, updating said first value with the result of squaring, modulo said modulus said first value, if said

Art Unit: 2135

fourth value is a one, updating said first value with the result of multiplying, modulo said modulus said first value by said second value (col. 7, lines 57-60, claims 19/a, 19/b and col. 7, lines 18-23); updating said bit with the next bit of said bit (The exponent bit position is updated whenever the processing moves to a new exponent bit – e.g. col. 6, lines 45-46), and executing steps of said algorithm on said bit until said bit being said least significant bit of said exponent (Finally, the value is subtracted from I, which has the effect of decrementing I if the least significant bit of v is set. At step 145, the device determines whether the exponentiation has completed. If I is less than zero, processing continues to step 160 – e.g. col. 6, lines 38-43); and storing and output said first value (Return (R) – e.g. col. 4, lines 25).

The difference between the claimed invention and that disclosed in Kocher et al. is the latter does not disclose the claimed feature of assigning said message to a second value. However, such missing feature in Kocher et al. is clearly taught in paragraph [0062] aforementioned Benoit reference, the same field endeavor. It would have been obvious for a person having ordinary skill in the art to incorporate such well known feature as taught in the Benoit reference into the Kocher et al. method motivated by adding "this makes it possible to indicate in which register the correct result is situated" (Benoit, paragraph [0062])

Application/Control Number: 10/615,065

Art Unit: 2135

As per claims 2 and 4, combination of Kocher et al. and Benoit disclose a method as applied in claim 1. Kocher et al. further discloses wherein if said bit is said least significant bit of said exponent, said fourth value is initialized as 1 (step 100 of fig. 1) and wherein said inverter is used for output a one if input a zero into it, and output a zero if input a one into it (col. 5, lines 48-50 and col. 6, lines 16-17)

As per **claim 3**, combination of Kocher et al. and Benoit discloses a method as applied in claim 2. Kocher et al. further discloses wherein said bit is one bit of bits of said exponent and is a one or a zero (col. 4, lines 40-42).

As per **claim 5**, Kocher et al. discloses an apparatus for protecting public key schemes from timing, power monitoring and fault attacks comprising:

means for obtaining a message for use in a cryptographic operation (This process is performed by a general purpose microprocessor, by a dedicated cryptogrocessor, or by some other underlying processor, in accordance with software and/or hardwired instructions —e.g. col. 5, lines 39-43);

means for obtaining a modulus and an exponent corresponding to said crypotographic operation, wherein said exponent contains at least

one bit; means for initializing a first value as a one, and assigning said message to a second value; means for executing a modulo exponentiation algorithm on each bit of said exponent from the most significant bit to the least significant bit, wherein said algorithm comprising: means for input a bit into an inverter and storing the output as a third value, and assigning the next bit of said bit as a fourth bit; means for determining whether said third value is a one or a zero; means for updating said first value with the result of squaring if said third value is a one, modulo said modulus said first value, updating said first value with the result of multiplying, modulo said modulus said first value by said second value if said third value is a one; means for determining whether said fourth value is a one or a zero; and means for updating said first value with the result of squaring, modulo said modulus said first value if said fourth value is a zero, updating said first value with the result of multiplying, modulo said modulus said first value by said second value if said fourth value is a one; means for updating said bit with the next bit of said bit, and executing steps of said algorithm on said bit until said bit being said least significant bit of said exponent; means for determining whether said bit is a one or a zero; and means for storing and output said first value (col. 5, lines 39-43 and col. 6, lines 1-3)

The difference between the claimed invention and that disclosed in Kocher et al. is the latter does not disclose the claimed feature of means

Art Unit: 2135

for assigning said message to a second value. However, such missing feature in Kocher et al. is clearly taught in paragraph [0062] aforementioned Benoit reference, the same field endeavor. It would have been obvious for a person having ordinary skill in the art to incorporate such well known feature as taught in the Benoit reference into the Kocher et al. method motivated by adding "this makes it possible to indicate in which register the correct result is situated" (Benoit, paragraph [0062])

As per **claims 6-7**, combination of Kocher et al. and Benoit disclose an apparatus as applied in claim 5. Kocher et al. further discloses wherein said bit is one bit of bits of said exponent and is a one or a zero (col. 4, lines 40-42) and wherein said inverter is used for output a one if input a zero into it, and output a zero if input a one into it (col. 6, lines 12-19).

As per claims 8-11, combination of Kocher et al. and Benoit disclose the claimed method of steps as applied above in claims 1-4. Therefore, combination of Kocher et al. and Benoit disclose the claimed logic code embodied in a computer readable medium for carrying out the method of steps.

Art Unit: 2135

## Conclusion

14. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure.

- ➤ Joye et al. (US 2005/0084096) discloses a method for implementing in an electronic component a cryptographic algorithm using calculating means.
- ➤ Joye et al. (US 2004/0184604) discloses a secure method for performing an exponentiation operation.

Art Unit: 2135

#### **Contact Information**

Any inquiry concerning this communication or earlier communications from the examiner should be directed to April Y. Shan whose telephone number is (571) 270-1014. The examiner can normally be reached on Monday - Friday, 8:00 a.m. - 5:00 p.m., EST.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Kim Y. Vu can be reached on (571) 272-3859. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see http://pair-direct.uspto.gov. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free). If you would like assistance from a USPTO Customer Service Representative or access to the automated information system, call 800-786-9199 (IN USA OR CANADA) or 571-272-1000.
